

MARKET DAY COUNT SHEET

Record a starting count and a final return count for each product.

Market _____ Date _____ Operator _____

Item	Unit	List \$	Packed	Added	Returned	Sample/loss	Sold	List sales \$	Notes

Sold = packed + added - returned - samples/loss. Use the same units throughout a row.

CASH AND PAYMENT CLOSEOUT

Opening cash float _____	Closing cash _____	Card receipts _____
Other receipts _____	Sales tax included _____	Payment fees _____
Booth fee _____	Other event costs _____	Closeout notes _____

HOW TO CLOSE OUT A MARKET

Use the field sheet during the event, then enter the same numbers in the workbook.

1 Before opening

Write the market and date. List each item, unit, list price, and packed quantity. Count your opening cash float.

2 During the market

Record stock added and any samples, spoilage, or giveaways. Record price changes or bundles in Notes.

3 At close

Count unsold stock as Returned. Count closing cash, then copy card and other receipts from your payment records.

4 In the workbook

Enter packed, returned, and list price on every used row. Leave Added and Samples/loss blank when zero.

5 Review the difference

Net collected is total receipts less sales tax. Compare that to count-based sales at list price.

WORKED EXAMPLE

10 boxes packed, 3 returned, 0 lost = 7 sold. At \$4 each, count-based sales are \$28.

\$50 opening cash and \$78 closing cash = \$28 cash sales. With no other receipts or tax, difference = \$0.

What the numbers mean

A nonzero difference may come from discounts, bundles, tax entry, payment timing, or an incorrect count.

After event costs excludes product cost, labor, income tax, and costs you did not enter. It is not profit.
